The skeletal system includes all of the bones, cartilages, and ligaments of the body that support and give shape to the body and body structures. The skeleton consists of the bones of the body. For adults, there are 206 bones in the skeleton. Younger individuals have higher numbers of bones because some bones fuse together during childhood and adolescence to form an adult bone.

Bone tissue, or osseous tissue, is a hard, dense connective tissue that forms most of the adult skeleton, the internal support structure of the body. Physiology - Skeletal System - BrianMac  
The skeletal system acts as a foundation for the human body. This system includes all of the bones and joints that allow movements and support for the structure of a human. There are many functions that bones can serve, such as producing blood cells in bone marrow. Bones also provide an insertion point for muscles that lie superficial to bones.

Bone, or osseous tissue, is a hard, dense connective tissue that forms most of the adult skeleton, the support structure of the body. In the areas of the skeleton where bones move (for example, the ribcage and joints), cartilage, a semi-rigid form of connective tissue, provides flexibility and smooth surfaces for movement.

ranges of movement. This is because bones have joints at both ends that connect the bones to each other, but still let them twist and turn in different directions. The skeletal system is often assisted by the muscular system and controlled by the nervous system.
