Periodontal Regenerative Therapy By Anthon Sculean

Periodontal regeneration has been observed following the use of a variety of bone grafts and substitutes, guided tissue regeneration, biological factors and combinations thereof. Combination approaches appear to provide the best outcomes, whilst implantation of alloplastic material alone demonstrated limited, to no, periodontal regeneration.

Abstract. Introduction: The goal of regenerative periodontal therapy is the reconstitution of lost periodontal structures (i.e., the new formation of root cementum, periodontal ligament, and alveolar bone). Results from preclinical and clinical research in the last decade have provided evidence on the biologic rationale and clinical applications of an enamel matrix derivative (EMD) protein in periodontal wound healing and regeneration.
