Alkanes Worksheet & Cheatsheet for GCSE | Teaching Resources
One way of checking whether the name you have given to an alkane is reasonable is to count the number of carbon atoms implied by the chosen name. For example, if you named a compound 3 ethyl-4 methylheptane, you have indicated that the compound contains a total of 10 carbon atoms—seven carbon atoms in the main chain, two carbon atoms in an ethyl group, and one carbon atom in a methyl group.

3.5: Naming Alkanes - Chemistry LibreTexts
Because the first set of numbers is lower, the chain is numbered properly. The longest chain in a branched alkane is called the parent chain. Count the number of carbons in each branch. These groups are called alkyl groups and are named by adding the suffix -yl to the appropriate alkane prefix.

How to Name Branched Alkanes in Chemistry - dummies
To name a branched hydrocarbon, the name of the substituent is combined with the parent name of the hydrocarbon without spaces. However, there is likely one more step. The longest chain of the hydrocarbon must be numbered, and the locant (numerical position of the substituent) must be included to account for possible isomers. As with double and triple bonds, the main chain is numbered to give the substituent the lowest possible number.

In the following practice problems, we will go over naming alkanes using the IUPAC nomenclature rules which include finding the parent chain, numbering it to have the substituents in the correct positions and finally putting all of this together to name the compound. The next exercise will teach you drawing the structure based on the IUPAC name.
