A core philosophical project is the attempt to uncover the
fundamental nature of reality, the limited set of facts upon which all
other facts depend. Perhaps the most popular theory of fundamental
reality in contemporary analytic philosophy is physicalism, the view
that the world is fundamentally physical in nature. The first half of

this book argues that physicalist views cannot account for the evident reality of conscious experience, and hence that physicalism cannot be true. Unusually for an opponent of physicalism, Goff argues that there are big problems with the most well-known arguments against physicalism: Chalmers' zombie conceivability argument and Jackson's knowledge argument and proposes significant modifications. The second half of the book explores and defends a recently rediscovered theory of fundamental reality or perhaps rather a grouping of such theories known as 'Russellian monism.' Russellian monists draw inspiration from a couple of theses defended by Bertrand Russell in *The Analysis of Matter* in 1927. Russell argued that physics, for all its virtues, gives us a radically incomplete picture of the world. It tells us only about the extrinsic, mathematical features of material entities, and leaves us in

the dark about their intrinsic nature, about how they are in and of themselves. Following Russell, Russellian monists suppose that it is this 'hidden' intrinsic nature of matter that explains human and animal consciousness. Some Russellian monists adopt panpsychism, the view that the intrinsic natures of basic material entities involve consciousness; others hold that basic material entities are proto-conscious rather than conscious. Throughout the second half of the book various forms of Russellian monism are surveyed, and the key challenges facing it are discussed. The penultimate chapter defends a cosmopsychist form of Russellian monism, according to which all facts are grounded in facts about the conscious universe.

review. This is volume one of a planned three volume set. Volume one covers the scientific method, matter and energy. Volume two will cover physics (motion, gravity, pressure, etc) and chemistry (chemical bonding, acids-bases, etc). Volume three will cover everything else (waves, pseudo-science, etc). This is intended to be a middle school level physical science textbook, but it is not written as one. It is easy to understand and funny. It is not only targeted at a middle school student but sounds like one wrote it. A lot of immature examples are used, kids like this. This is not your normal textbook, it is fun to read, but includes all the vocabulary and complex ideas. The current textbooks are full of boring information but they are useless if no one wants to actually read them. A student will want to read this one, so will an adult. It explains in easy language, complex topics. There are links to demonstrations,

experiments, simulations, videos, and funny examples of science. This book is written to make physical science fun, as all science should be. Normally a textbook is written so the teacher can make a lesson from it, this one is the opposite. These are my lessons converted into a textbook. I know the lessons and examples work, so the textbook should also. Since this is an e-book it also includes links to my power point lessons (in video form), links to videos, demonstrations, and simulations. There are a lot of links in each chapter. This is self-published book designed to be an affordable online textbook for middle school or home school children. Volume one covers the Scientific Method, The basics of Matter, and Energy. An approach to understanding religion that draws on both humanities and natural science but rejects approaches that employ simple monisms and radical dualisms. In *Beyond Heaven and Earth*, Gabriel Levy argues that collective religious narratives and beliefs are part of nature; they are the basis for the formation of the narratives and beliefs of individuals. Religion grows out of the universe, but to make sense of it we have to recognize the paradox that the universe is both mental and material (or neither). We need both humanities and natural science approaches to study religion and religious meaning, Levy contends, but we must also recognize the limits of these approaches. First, we must make the dominant metaphysics that undergird the various disciplines of science and

humanities more explicit, and second, we must reject those versions of metaphysics that maintain simple monisms and radical dualisms. Bringing Donald Davidson's philosophy—a form of pragmatism known as anomalous monism—to bear on religion, Levy offers a blueprint for one way that the humanities and natural sciences can have a mutually respectful dialogue. Levy argues that in order to understand religions we have to take their semantic content seriously. We need to rethink such basic concepts as narrative fiction, information, agency, creativity, technology, and intimacy. In the course of his argument, Levy considers the relation between two closely related semantics, fiction and religion, and outlines a new approach to information. He then applies his theory to discrete cases: ancient texts, modern media, and intimacy.

Young children are intuitive, emergent scientists - they observe, raise hypotheses, experiment and notice patterns. Most of our everyday actions at home and in other settings, inside and outside, have a scientific basis and it is through these early experiences that children formulate their ideas about the world in which we live. This accessible book introduces the simplest form of the principles and the big ideas of science and provides a starting point for encouraging children to have an interest and experiential understanding of basic science and engineering. It shows you how you can support young children in exploring everyday phenomena and develop their scientific language skills through readily available resources and hands-on experiences. Each chapter focuses on a different aspect of science and includes: a summary of the 'big ideas' to refresh your own scientific knowledge; numerous

activities that encourage young children to observe, question and carry out their own investigations; a useful list of everyday resources and relevant vocabulary. Providing a wealth of exciting, meaningful ways to promote scientific experiences and learning, this highly practical book will help you to build on children's natural curiosity about the world and develop their understanding through your everyday provision in early years settings and at home.

This book addresses core issues related to school learning and the use of developmental/cognitive science models to improve school-based instruction.
