To develop a simulation of a complex dynamic system, you must first develop mathematical models of major system components, as well as of any significant interactions between the system and its operational environment. Here's an introduction to the development of mathematical models of dynamic systems. A mathematical model is an algorithm or set of equations that is combined with a set of data values to represent the significant behavior of a system, process, or phenomenon.

In this work, we review the state of the art of dynamic modeling and related methods used for metabolic engineering applications, including approaches based on hybrid modeling. We describe approaches developed to undertake issues regarding the mathematical formulation and the underlying optimization algorithms, and that address the phenotype prediction by including available kinetic rate laws of metabolic processes.

In addition, dynamic models incorporate the intertemporal choices that a consumer (firm) must make when maximizing welfare (profits) over some time horizon. Medlock and Soligo (2002) developed a dynamic model of motor vehicle ownership and fuel use that generalizes to many other types of energy-using capital equipment. They showed that the demand for energy is determined by the consumer's wealth, the price of energy, the price of other goods, the user cost (or cost of owning and maintaining ...

The dynamic model represents the time-dependent aspects of a system. It is concerned with the temporal changes in the states of the objects in a system. The main concepts are - State, which is the situation at a particular condition during the lifetime of an object. Transition, a change in the state. Event, an occurrence that triggers transitions

What Are Dynamic Models? Dynamic models are simplified representations of some real-world entity, in equations or computer code. They are intended to mimic some essential features of the study system while leaving out inessentials. The models are called dynamic because they describe how system properties change over time: a gene's

A dynamical system is a manifold M called the phase (or state) space endowed with a family of smooth evolution functions Φ_t that for any element $t \in T$, the time, map a point of the phase space back into the phase space. The notion of smoothness changes with applications and the type of manifold. There are several choices for the set T . When T is taken to be the reals, the dynamical system ...
